

Attention First, page 72, prompts 32-33

Matthew Le | CIT 140 | Week 3 book form. Typed one-page version. Source edition locates these prompts in the Workbook, Section Seven, Designing Your Teams, Tools, and Human-AI World; the Kindle edition I purchased numbers that page 130.

Prompt 32. Tool and Template Inventory

List 3-5 practical tools, templates, or supports in your system. What does each one help the learner build, decide, or navigate? Working experience: the stakeholder consultation for the proposed QA Control Review.

- 1. Stakeholder map.** Helps participants navigate. Everyone can see who does the work, who is affected, who advises and who decides before the conversation starts, so nobody has to guess whether they are being consulted or asked to approve.
- 2. Decision-rights register.** Helps participants decide. One line per role stating what that role can and cannot authorize. It stops attendance being mistaken for approval and makes an unidentified sponsor visible instead of assumed.
- 3. Shift-aware availability grid.** Helps participants contribute. Names against shifts, filled in before a time is chosen. A night-shift operator cannot contribute to a session scheduled in the middle of their sleep.
- 4. Record request log.** Helps participants navigate. Each requested record with who asked, who holds it, access status and date. It turns an unnamed custodian from a blocked meeting into a tracked open item.
- 5. Open questions list.** Helps participants build. Unanswered items stay visible with the date they were asked, so silence is recorded as no answer rather than as consent.

Prompt 33. Identity and Role Support

Write 3 identity-building questions that help learners discover what they bring to the work.

- 1.** Which parts of this work do you touch directly, and what would you notice first if it changed?
- 2.** What are you responsible for here that someone outside your role would probably not see?
- 3.** What do you know about how this cell actually runs that is not written down anywhere?

How these improved my consultation plan

Question 3 targets undocumented knowledge, which is what the night-shift operator holds and what the packet currently lacks, since it contains the supervisor's account rather than operator interviews. I moved that question to the front of the operator interview instead of opening with the proposed workflow. Question 2 separates real responsibility from job title, which is the gap behind an unnamed record custodian. From prompt 32, the record request log converts that gap into a tracked item with a person, a date and an access status, which is what Engineering needs before anyone promises delivery dates. I did not invent any stakeholder answers; these are questions to ask.
